INTRODUCTION

Thank you for choosing the **Epic PWRgate**the high power OR Gate with a built-in smart battery charger. It makes a true solid-state UPS for the ham shack. The **Epic PWRgate** is West Mountain Radio's third generation PWRgate product. It uses advanced technology to achieve a very low power loss, and has maximum flexibility to charge modern batteries.

The **Epic** eliminates the danger of connecting a power supply directly across a battery, which can damage many power supplies. The **Epic** also avoids introducing hum and RF interference, caused by most lead-acid battery chargers, by using a standard power supply. Furthermore, most lead-acid battery chargers are designed for flooded lead-acid marine or automotive batteries, and are inappropriate for charging sealed lead-acid gel, AGM and Lithium type batteries.

***Note: Flooded Lead-Acid batteries are not recommended for Amateur Radio usage**

The **Epic** is best with the following battery types:

- **Gel** - Sealed lead-acid, not AGM
- **AGM** - Sealed lead-acid, Absorbed Glass Mat (lighter weight and less expensive; fewer charge/discharge cycles than Gel)
- **Lithium** - (to date) Lithium Iron Phosphate ("LiFePO4") is recommended for Amateur Radio usage. All default charging parameters and references in this manual are for LiFePO4. Other Lithium chemistries should be compatible with Epic, however custom charging parameters will need to be set.

The **Epic** transfers 40 amperes at 12 volts DC in a continuous safe manner. It connects a battery and a power supply to a load, while electrically isolating both the battery and the supply from each other. Whenever the power supply is on, the supply feeds the load. It also charges the battery with a high-current safe battery charger. Whenever the power supply is off, the battery will feed the load. If either the power supply or the battery is malfunctioning, neither draws current from the other. The switching is instantaneous. If the power supply is OFF and a solar panel input is present, the battery will charge from the solar panel.

The **Epic** is very useful in the ham shack, and even more useful in a repeater installation. Communication equipment will remain operative during AC power blackouts and power supply failures. Power supplies and batteries can be swapped out while equipment continues to be powered and without glitches.

Additionally, the **Epic** and a power supply may be used solely as a permanently installed battery charger. This also may be configured to run a radio station directly from the battery.

**Please read the following instructions
BEFORE installing the Epic**

Epic PWRgate Features

- Instant switch from a power supply to/from a battery
- Only a 0.05V drop from the power source to the output (compare to 0.33V on Super PWRgate PG40S)
- Properly charges a Lead-Acid (AGM or Gel) and LiFePO4 batteries
- Operates at a considerable lower temperature than Super PWRgate PG40S, thus eliminating the large heat sink
- Support for direct connection to a solar panel for battery charging of all chemistry types using Maximum Power Point Transfer (“MPPT”)
- Continuous output current of up to 40A fully supported
- Charge rates up to 10A supported
- USB port for monitoring the system or to program specific charge parameters
- Complete LED status indicators of unit status
- Battery charge suspend switch to eliminate charger noise for 30 minutes
- May be programmed for vehicle use where charging is suspended when the vehicle is not running
- Optional temperature probe to control charging based on battery temperature

Package Contents

- Epic PWRgate Unit
- USB-micro Cable, 6 ft
- 4 Powerpole® Retention Clips
- User Manual
- Reference Card for LED Indicators

WARNINGS

The following may damage the unit:

- Supplying over 16V to the power supply jack
- Supplying over 30V to the solar panel jack
- Operating in an environment over 110 degrees F
- Drawing more than 40A on the output jack for more than a short time
- Connecting a battery of the wrong type (as selected by the jumpers) may damage the battery and/or cause the battery to start on fire or explode
- The Epic does not have internal fuses. It is advisable to have a safety fuse close the battery (like 50A)
- If the output is connected directly to your equipment (as opposed to connected to a RIGrunner or PWRguard), then that cable should be fused

INSTALLATION & SET-UP

Choosing a Mounting Location

Pick a location that is central to the power supply, battery, as well as the load or 12V distribution panel. Radios and many 12V devices draw large amounts of current. All wires have resistance, so it is good practice to keep them as short as possible and to use a larger gauge wire to minimize voltage drop. The engine compartment of a vehicle is not a suitable location for mounting.

The **Epic** can be installed in any orientation. It is recommend to use in a cool dry location and preferably well ventilated. If placed in direct sunlight, it will absorb heat and get unnecessarily hot.

The **Epic** can be mounted using #8 hardware in the mounting holes.

Powerpole® Connectors

Powerpole® connectors can be installed by soldering or crimping. Crimping is recommended for the best connection. Be sure to make good connections. For detailed Powerpole® connector installation tips see RIGrunner support pages at <http://www.westmountainradio.com/ppinfo>.

Power loss is minimized by using short cables of a high (lower number) gauge (AWG) cable. Go to the following website:

www.westmountainradio.com/calculators to determine the trade-offs with cable loss. Select the "Find Cable Size" option and fill in the information. The calculator will show the percentage of power loss in the cable. For example, at 100W, a 6 foot 10 AWG cable will have a 2% loss; whereas a 16 AWG cable will have 8% loss.

Connecting the power supply

The power supply wire should be heavy gauge and as short as possible; recommend #10 wire. Most power supplies have 1/4 inch studs. Note that West Mountain Radio carries 3, 6 and 10 feet long power supply cables, #10 red and black insulated wire with 1/4 inch ring terminals on one end and Powerpole® on the other.

Be sure to connect the RED Powerpole connects to the RED wire and connect to the PLUS terminal on the supply. Similarly, make sure that the BLACK Powerpole® connect to the BLACK wire and connect to the NEGATIVE terminal on the supply. Check that the connections at the power supply are well tightened.

Plug this cable from the power supply into the **Epic** connector marked Power Supply. Confirm that the Powerpole® are plugged together securely, and that the wire is straight at the connection point and is not under strain or bent over.

Power Supply - Connectors are intended for a power supply connected to AC. The normal voltage is 13.8V to 14.5V. It is recommended this voltage be at or slightly higher than the charge voltage for the battery being used: 13.9V for a Gel, 14.3V for an AGM, and 14.5V for a LiFePO4. Expect the voltage to the equipment to be at approximately this same voltage. The unit will operate under battery power if no power is on this input. Set the internal jumpers to select the right type of battery or use the USB interface to set a custom charge profile.

Connecting the Battery

A fuse should be installed in the positive lead directly at the battery terminal.

Note, any short in the battery wire, connector, or load could result in fire and battery explosion.

Caution: Handle batteries with knowledge and appropriate care. Batteries have dangerous chemicals that can seep out. Batteries can emit extremely explosive hydrogen gas. Batteries, especially automotive and marine flooded lead acid, must be used in a strong, ventilated enclosure. Sealed lead acid batteries are much safer but must be correctly handled with care.

NEVER make the last connection directly to a battery causing a spark that could cause the battery to explode, sending debris and acid in all directions. Batteries can get very hot when improperly charged or if a cell gets shorted. Batteries will explode during charging or discharging for a variety of reasons. Batteries are safe when handled properly.

Choose a 12 volt battery with an ampere-hour rating according to your power

needs. If the batteries are placed indoors they must be sealed for safety reasons. Again, it is very important to place a fuse at the positive battery terminal.

Additional assistance may be found:

http://www.westmountainradio.com/capacity_calculator.php

West Mountain Radio carries size 24 Gel and AGM batteries, as well as smaller and larger batteries.

Large batteries have side, post, or threaded terminals. Deep cycle, marine, AGM, and others usually have 3/8 inch and 5/16 inch studs. Therefore, it is recommended to use a short 3 feet #10 wire, Powerpole® on one end, an in-line fuse (40-50A), and ring terminals for the battery end. West Mountain Radio carries a battery fuse kit, wire, and Powerpole®.

Fully charged 12 volt Lead Acid batteries exhibit around 13.5 volts open circuit. When supplying current, the battery's internal resistance diminishes the voltage. For instance, a 70 Ah battery will drop to 12.3 volts at 10 amperes at half discharge. The **Epic** will give a drop of 0.05 volts, thereby providing 12.25 volts to the radio. LiFePO4 batteries do not have this drop until they are over 90% depleted.

The power supply can be adjusted to allow for a maximum charge to the battery. Use a good voltmeter to get an accurate reading. Most power supplies have an internal pot, even if it is a fixed voltage supply. Read the service and calibration manual for instructions for each power supply.

All major radio manufacturers specify that the radio will operate up to 15 volts DC. Therefore, using the **Epic** at an elevated voltage should not harm the equipment. Vehicle alternators also will supply a higher voltage for battery charging.

Gel Cells

Adjust the power supply to 13.9V to achieve a full charge.

AGM Cells

Adjust the power supply to 14.3V to achieve a full charge.

LiFePO4 Cells

Verify the charge voltage with the battery manual. Most large LiFePO4 batteries have electronics between the terminals and cells. The optimum charge voltage will there vary somewhat. The popular Bioenno Power batteries work well at 14.5V.

Non-Standard Cells

Set the charge voltage using the USB port and set the power supply around 0.1V over the charge voltage.

Connecting the Load or Power Strip

Output - Connectors are intended to power equipment. It may go to a single piece of equipment or to a distribution panel (i.e. RIGrunner). There is no fuse or internal current limiting. Expect this voltage to be about 0.05V lower than the input voltage from the power supply or voltage from the battery; whichever is higher.

Plug the wire from the power strip or equipment into the **Epic** connector marked **OUT** (output). Confirm that the Powerpole® are plugged together securely, and that the wire is straight at the connection and is not under strain or bent over.

Solar Panel - Connectors are intended to connect to a solar panel, NOT A CHARGE CONTROLLER. When the power supply is not present (or off) and there is over 13V on this input, the battery will be charged from this input. This is an optional input to be used only with a solar panel. When both a solar panel and power supply are active, the solar panel is used for charging.

Internal Jumpers

Remove the case screws to access the internal jumpers. Select the correct chemistry and maximum charge current. Lead Acid batteries maximum charge current is usually 10% of the AmpHour rating. LiFePO4 batteries usually use the AmpHour rating, some specify 50% to be safe, or others may specify being able to handle double.

The jumper selection shown would be correct for a Gel Lead-Acid battery that is 50AH. This is the standard configuration for the **Epic**.

These jumpers are only checked when the unit is powered up. It is, therefore, recommended to only change jumper position when everything is disconnected.

In order to set the charging parameters manually, remove both jumpers and use the USB interface on page 10.

System Checkout

When the power supply and battery are connected, and the **Epic** is driving a radio, a quick checkout procedure should be followed:

- Run your radio, and unplug the power supply. The radio should operate without interruption now from the battery.
- Plug the power supply back in, and the radio will now be powered from the supply. If you have an ammeter on the supply it will show current.

An in-line meter, such as PWRcheck by West Mountain Radio, may be used to measures volts, amperes, watts, ampere-hours, and watt-hours simultaneously.

Place the PWRcheck in series with the battery to get an accurate reading of the charge current. Unplug the load from the **Epic** to measure the battery's charging current. Refer to the charging circuit description to verify the different states when measuring the charging current.

Epic PWRgate Charger

The charging circuit is a smart battery charger. The charging circuit, which is always connected to the battery, uses the power supply or solar panel as the current source. It charges the battery automatically by knowing the battery's voltage. It also changes charging state if the power supply goes from "off" to "on", following a power outage, and it also changes state if the battery voltage drops when supplying heavy current (such as transmit). These conditions are interrelated to provide proper charging automatically.

The charger is a safe battery charger. It supplies the rated current if the battery is heavily discharged. Current drops in a smooth and progressively diminishing manner as the battery nears full charge. Note, that the charger has feedback and it cannot overcharge a 12 volt battery, provided the jumpers are set correctly. Also, it will not charge a battery that has a dead cell.

The charging circuit has three jumper selectable charging current settings, 1A, 5A, 10A, to be chosen appropriately for the battery's rating. Other settings may be selected via the USB cable.

Push Button - A switching regulator is used for battery charging. Because the Epic has an MPPT charge controller, there is a possibility of RFI, and the Suspend button is on the unit. In addition, charging can take current from the power supply that some might prefer be used for transmit. The suspend button may be used to control the charging as follows:

Short press while charging	Suspends charging for 30 minutes
Short press while suspended	Resumes charging
5 second press while charging	Terminates charging
5 second press when not charging	Starts a new charge cycle to top off the battery
Short press with no power supply or solar	Turns off the LEDs to save power

Epic PWRgate LED Status Indicators	
SOLAR LED	
Green - Solid	Voltage Good / In Use for Charging
Green - Flashing	Voltage Good / Not in Use for Charging
POWER SUPPLY LED	
Green	Power Good / In Use
Red	Low Voltage or Internal Component Damaged
Off	No Power Supply Detected
BATTERY LED	
Green - Solid	Powering from Battery / Good
Green - Quick Flashing	Battery detected / Charger Off (Check: Charger disabled via USB, or Charging suspended by button press)
Green - Flashing	Warning - Battery Supplying <12V
Red - Flashing	Warning - Battery Supplying <11.7V
Red	Battery Bad or Charger Damaged Disconnect Battery!
Blue	Battery fully Charged and Ready
Blue - Flashing	Battery Charging (illumination pulse will increase as battery nears full charge)
Blue - Periodic Flicker	Battery Trickle Charging
Red / Blue Alternating	Warning - Battery Supplying <11.7V while Charging from Solar
Green / Red Alternating Blip	Charging is stopped because temperature is out of range.
Off	No Battery Detected

USB Port

The USB port may be accessed by removing the plastic plug on the upper right of the unit. A COM port terminal program may be used to see the data or the **WMR Device Diagnostics Utility** program for RIGblasters may be used. Drivers are not needed for Windows 10. If using an older version of Windows, download and install the drivers before plugging the cable into the USB port on the PC.

Download the FREE WMR Diagnostics Utility software at:
<http://www.westmountainradio.com/diagnostics>

When the USB port is connected to the **Epic**, the device status is shown. This includes the voltages on each port, the charger status, and the charge current.

If both jumpers have been removed, then the USB port may be used to set custom charging parameters. Press "S" to set the charge parameters.

USB Settable Parameters

Prompt	Range	Description
Battery Type	1 - Disable 2 - Gel 3 - AGM 4 - LiFePO4 5 - Other	1 Disables the charger. Options 2-4 fill in the default values for the remaining parameters. Only pressing ENTER will <u>not</u> reset the other parameters.
Max Charge Voltage	9V to 16V	This is the target voltage that the battery should be charged to.
Max Charge Current	1A to 10A	This is the maximum current the Epic charger will allow to flow into the battery during charging.
Min Charge Current	0.1A to 1.9A	Charging stops when the current draw drops below this level.
Trickle Current	0.1A to 1.9A	After the battery is fully charged, this is the current that is allowed to flow into the battery to maintain it.
Recharge Voltage	9V to 16V	When the voltage drops below this on a battery that has been charged, the charger starts up again.
Max Charge Minutes	30 to 65535	Charging is stopped and the battery is considered bad if charging went on for this period of time.
Retry After Abort Minutes	30 to 65535	After charging was aborted, it will restart after this many minutes.
Min Supply Voltage for Charging	9V to 16V	Normally 13V, but can be set to 14V if used in a vehicle <u>and</u> desired to charge while alternator is on.
Lowest Charge Temp	-40 to 150 degrees F	This prompt only appears if the temp probe is used. Charging will terminate if the temperature falls below this.
Highest Charge Temp	-40 to 150 degrees F	This prompt only appears if the temp probe is used. Charging will terminate if the temperature goes over this.

Optional Temperature Probe

The temperature probe provides valuable data for the **Epic** for charging. If the temperature of the battery is too high or low on a LiFePO4 battery, the **Epic** will cease charging the battery. For Lead-Acid batteries, the **Epic** will adjust the charge voltage dependent on the battery temperature. This allows for the most optimum battery charging.

If a probe is not used, be sure to never charge a LiFePO4 below freezing temperatures for safety reasons.

Installation - Remove enclosure screws and take off unit top. Attach the 2-pin end of the temperature probe to the 2-pin header in the very top-right corner of the circuit board. There is no polarity on the temperature probe, connect it either way. Feed the cable through the USB port hole (if not being used) or between the Powerpole® connectors for the Solar output.

USB Monitor Example

Charging	PS=14.05V	Batt=12.47V,	9.6A	Sol=0.00V	Min=14
Charging	PS=14.05V	Batt=12.47V,	9.5A	Sol=0.00V	Min=14
Charging	PS=14.05V	Batt=12.48V,	9.6A	Sol=0.00V	Min=14
Charging	PS=14.05V	Batt=12.48V,	9.6A	Sol=0.00V	Min=15

PS = power supply voltage

Batt = battery voltage and charge current

Sol = solar panel voltage

Min = number of minutes in this state (charging)

Temp = temperature in degrees F if the probe is installed

SPECIFICATIONS

Maximum Voltage:	PS 16V / Solar 30V
Maximum Current:	40 Amperes
Maximum Charge Current:	10A
Voltage Drop:	0.05 VDC
Connectors:	Anderson Powerpole®, 45A
Size:	4.5 x 3.375 x 1.25 in
Weight:	0.35 lbs
Mounting Holes:	Four - 0.175 d, #8 hardware

Charging Circuit Default Settings:

Jumper ⇨	Gel	AGM	LiFePO4
Charge Voltage	13.85V	14.4V	14.5V
Charge Current	1, 5 or 10 amps	1, 5, 10 amps	1, 5, 10 amps
Stop Charge Current	0.25A	0.25A	0.5A
Trickle Charge	0.15A	0.15A	0A
Recharge Voltage	12.1V	12.1V	12.6V
Max Charge Time	25 hrs	25 hrs	25 hrs
Retry Time	4 hrs	4 hrs	4 hrs
Chemistry	Gel	AGM	LiFePO4
Min PS Volts	13.9V	14.45V	14.45V
Lowest Temp (F)	0	0	35
Highest Temp (F)	120	120	110
Use Temp for Charge	Yes	Yes	No

*The above parameters may also be changed via the USB interface.

Mounting Template

Visit the Epic PWRgate product page and click on the Manual tab for a mounting diagram.

NOTES:

- **Charge Voltage** is the target maximum voltage during normal charging. It will take a while for the battery to achieve this voltage and even when it does, charging is not yet complete. The power supply must be set to at least 50mV above this for a full charge.
- **Charge Current** is the goal for the current supplied to the battery during the bulk charge phase. The actual current draw may be up to 10% over this for periods of time and toward the end of the charging, will be much less than this.
- **Trickle Charge** is the maximum current that will be used to maintain the battery voltage after the normal charging is complete. The actual current will usually be less than this for a fully charged battery. For a lead-acid battery, the maintenance voltage is always 13.55V. Never trickle charge a Lithium battery at any level.

ACCESSORIES

Temperature Probe

Epic PWRgate Warranty

Epic PWRgate is warranted against failure due to defects in workmanship or materials for one year after the date of purchase from West Mountain Radio. Warranty does not cover damage caused by abuse, accident, misuse, improper or abnormal usage, failure to follow instructions, improper installation, alteration, lightning, or other incidence of excessive voltage or current. If failure occurs within this period, return the *Epic PWRgate* or accessory to West Mountain Radio at your shipping expense. The device or accessory will be repaired or replaced, at our option, without charge, and returned to you at our shipping expense. Repaired or replaced items are warranted for the remainder of the original warranty period. You will be charged for repair or replacement of the *Epic PWRgate* or accessory made after the expiration of the warranty period.

West Mountain Radio shall have no liability or responsibility to customer or any other person or entity with respect to any liability, loss, or damage caused directly or indirectly by use or performance of the products or arising out of any breach of this warranty, including, but not limited to, any damages resulting from inconvenience, loss of time, data, property, revenue, or profit, or any indirect, special incidental, or consequential damages, even if West Mountain Radio has been advised of such damages.

Except as provided herein, West Mountain Radio makes no express warranties and any implied warranties, including fitness for a particular purpose, are limited in duration to the stated duration provided herein.
